

Group Name: Working Our Ass-embly Off
Phase 6 Contributions

Contributions:

Dawn Balaschak:

- I did the entire system integration, again :D. I established foundations for and ported over phase 5 files, and drafted the comprehensive implementation plans. She then performed heavy integration work, physically wiring the cache and miss handler into the 5-stage CPU pipeline (RISCV_TOP.v), managing the stall signals in the pipeline registers, and fixing subsequent bugs within the cache. Also updated and fixed cacheing issues.

Kai Sprunger:

- I made the REPLACE_POLICY.v module and created tests and ran them successfully for it. I helped with debugging skeleton code mismatch errors and autograder errors.

Orion Brown:

- I helped determine our overall task list. I made the new main memory module. I made the module that coordinates memory reads and writes between our caches. Helped debug and trace cache state machine logic and aligned new modules with autograder expectations.

Eren Durham:

- I created the CACHE.v module, aligned it with the skeleton code and with the other modules. Additionally, I was able to help debug the code as the traces and autograder was released.
